Urea formation in experimental thyrotoxicosis. M. M. Smirn and L. V. Fisichenko (Med. Inst., Starobilsk). Fiziol. Zhur., Akad. Nauk Ukr. R.S.R., No. 2, 113-16 (Russian summary 116) (1955).—Fifteen rabbits were used in the study [MD] of the urea-forming function of the liver in exp'l. thyrotoxicosis. Hyperthyroidism in rabbits increases urea elimination via the urine 31%. The formation of urea from  $(\text{NH}_4)_2\text{CO}_3$  introduced into the stomach is decreased by approx. 25% in thyrotoxicosis. It is assumed that these changes in urea formation are connected with the hypoproteinosis and N deficiency of the liver and with the interaction between thyroxine and the vegetative nervous system. B. S. ①

colored thiosemicarbazides (I) which are formed by heating (10-15 minutes) alcoholic solutions of iso-cyanates with a dilute solution of 2,4-dinitrophenyl hydrazine. I is separated and identified by the method of "partition" paper chromatography, using the mixture of C<sub>2</sub>H<sub>5</sub>OH - pyridine -H<sub>2</sub>O (4:0.5:5.5) as the developer. The Rf values for the above mentioned I are cited which were obtained by various techniques of paper chromatography: ascending circular chromatography and by Matias method (RZhKhim Bkh, 1955, 10536).

Title : On the Problem of the Formation of Multiple  
Spots During Paper Chromatography With Two  
Competing Anions;

Orig Pub : Studii si Cercetari Stiint Acad RPR Fie Iasi Chim,  
8, No. 2, 259-276 (1957) (in Rumanian with French  
and Russian summaries)

Abstract : The authors give a detailed discussion of the  
problem of the appearance of several spots or of  
diffuse tails (comets) during the paper chroma-  
tography of metal ions deposited on the paper in  
the form of their salts. It has been found that  
when the solvent used consists of a mixture of

$C_2H_5OH$  and  $CCl_3COOH$ , and increase of the concentration of the  $CCl_3COOH$  in the solvent reduces the migration of cations deposited on the paper in the form of nitrates; the spots become more compact, though a complete disappearance of the tails is not observed in the majority of cases. When longer chain alcohols (4-5 C atoms) are used as the solvents, double spots and spots of higher multiplicity are observed to form, e. g., in the case of Fe and Cr, which apparently form complexes. Esterification, which takes place in acid solvents, also plays an important part; ethyltrichloroacetate inhibits the conversion of the nitrates to trichloroacetates. When the chlorides of the metals are used, the spots

TITLE: Tenth Anniversary of the Central Continuation Courses  
(Tsentr'lym kursam usovershenstvovaniya - 10 let)

PERIODICAL: Professional'no-Tekhnicheskoye Obrazovaniye, 1958, Nr 5,  
pp 18-19 (USSR)

ABSTRACT: These Central Courses have graduated 7,000 workers, and have at present 120 students at the year-classes and 200 at the half-year. There are also branches in main cities, which have graduated 10,430. The article ends with the statement that there are many faults in the system - one is that assignment to courses is poor.

and Fishel'zon, I.V., Engineer

TITLE: Improvement of the Operational Stability of the ST-35  
Telegraph

PERIODICAL: Vestnik, svyazi, 1959, Nr 6, pp 10-12 (USSR)

ABSTRACT: The constant speed control in the ST-35 telegraph is achieved by the use of an automatic regulator which varies the value of a resistance connected in series with the armature of the DTA-40, commutator-type, universal motor as shown in the circuit diagram (Figure 1). The authors state that to obtain optimal operation, the regulator contacts should be closed and opened for the same time intervals regardless of whether the motor is operating on direct or alternating current. The analysis of this circuit revealed that the contacts are opened for 0.3 of a revolution when operating on direct current, and for 0.7 of a revolution

Card 1/2

SOV/111-59-6-10/32

Improvement of the Operational Stability of the ST-35 Telegraph

when operating on alternating current. To improve this, they have designed a new circuit, shown on the circuit diagram (Figure 3), in which there are two 250-ohm resistors in series, instead of one 500-ohm resistor, and two 0.25-microfarad capacitors replacing one of 0.5 microfarads, which are interconnected by a switch for changing the operation from one current type to another. The improved circuit has been successfully tested in the Leningrad telegraph office. There are 2 circuit diagrams, 1 graph and 1 Soviet reference.
